How to set current workbook in vba.

Hide from the usual access thisworkbook worksheets ("Sheet1"). Visinable = xlveryhidden This is the way to make a sheet xlveryhidden vision Thisworkbook worksheets ("Sheet1"). When you want to protect you with THISWARKBOOK worksheets ("Sheet1"). Protect the password: = "MyPass" "Thisworkbook.worksheets (" Sheet1 "). Atect Password: = "MyPass" subscribed out of reach when you use spreadsheets, you can get the error: Execution time error 9 subscribed out of the break this means you have tried to access a spreadsheet that does not exist. The active sheet that the Active Object refers to the currently active spreadsheet. You can see how to do this in the example below. Fault a loop through the selected leaves, the following macro travels all the selected leaves, displaying their names. It is possible in Excel to have a sheet that is a grain. ' public sub writetocell1 () Write at Cálula A1 on leaves1, leaves2 and sheet3 thesisisheets ("Sheet1"). Range ("A1") = "Hello World" Thatworkbook.worksheets ("Sheet2"). Range ("A1") = "Hello World" Thisworkbook.worksheets ("Sheet3"). Range ("A1") = "Hello World" End sub the spreadsheet collection always belongs to a workbook. If the active workbook will be used by pattern. To try these examples, you must add a sheet of granals to your workbook first to see the difference. It will also discuss how to activate, select and go to spreadsheets (and more). If you want to change the name, you can do this easily using Name property. The following example uses for each loop. The second example does the same with the collection of spreadsheets. Activsheet.Name = "Newname" with Activsheet using instrument with instruction allows you to optimize your process when working with objects (such as leaves or activsheet). Enable the spreadsheet (defining the sheet of activity) to define the use Activsheet Activsheet Spreadsheets ("entry"). Activate the Activate Sheet command actually "go" to "the sheet, changing the visible sheet. Use .Select. You can use it to protect, hide, add, move or copy a spreadsheet. If you want to use the spreadsheet who is currently active, use Activsheet. (No installation required!) Free download to the examples of a VBA á € The visionary starts with a sheet of clean paper and re-imagin' The world is á € Malcolm Gladwell-ESTE post provides a complete guide to use the Excel VBA spreadsheet on Excel VBA. ' public sub adsheet () dim sht as worksheet 'Add new sheet before the set of active leaves SHT = Thisworkbook.worksheets.add 'Define the name of the sheet SHT.Name = "Accounts" 'Adds 3 new sheets before active sheet Thisworkbook.worksheets.add Count: = 3 Final Submarine In the previous example, you are adding spreadsheets in relation to the active spreadsheet. These elements will be used if everything you do. Sub getselectededsheetsname () c for each WS in ActiveWindow.Selectedworksheets Goto Práxima Sheet This Code will be destined for the next sheet. You should only use Activsheet if you have a specific need to consult the active spreadsheet. `` Range ("A1"). The name of the spreadsheet has changed. If the sheet of activity is the last sheet, it will go to the first sheet in the workbook. DIM SH as a SH = THISWARKBOOK.WORKSHEETS SET ("Sheet2") SH.Delete 'This line has been subscribed out of reach' as "Sheet2" not exists defined sh = thisworkbook.worksheets ("sheet2") a second EDITION is when you attribute a spreadsheet variance. Using spreadsheets is more straightforward than using workbooks. This can happen for the following reasons, the name of the spreadsheet given the spreadsheets is written incorrectly. ' public sub usecodename2 () From the Debug.print Codename.Name Codename.Range ("A1") = 45 Codename.visible = True End sub, this facilitates reading and protection of the enjoyment by changing the name of the sheet. Name of the way in other workbooks, there is a disadvantage in the use of the name of the Code. In the image, you can see that the name of the Code is the name outside of the midfielders and the name of the sheet is in the midstand. Activsheet in VBA, Activsheet refers to the current active spreadsheet. If the spreadsheet is in a different workbook, first get the workbook and then get the spreadsheet. This collection is simply called spreadsheets and is used in a very similar way to the collection of working paste. You can use the VBProject element of this workbook. There are two examples of the way below. When you add a spreadsheet, it is created with a standard name like "Sheet4". The name of the case may only be used for spreadsheets in the same workbook as a CO'dé. You can use the sheetfromcodename from above to get the name of the spreadsheet in other workpolds. I include this only to completeness and I recommend using the whole mother in the previous example instead of this. In the example below, we reflect the spreadsheet directly using the name of the Code. ' public sub allsheetnames () Prints the workbook and the names of the leaves for 'all sheets on open folder dim wrk as a dim sht workbook as a spreadsheet for each WRK in folders of work for each sht in WRK.Worksheets Debug. Print WRK.Name + ".": + SHT.Name Next Sht Next Wrk End Sub Using Leaf Collection The workbook has another collection similar to spreadsheets called leaves. Another way to get the name of the spreadsheet from an external workbook using the name of the Code. All the way your record, 90% involvement one or all of them. The following way shows how to do this. SH as a sheet SH = THISWARKBOOK.WORKSHEETS SET ("Sheet12") SH.DELETE Excel will display a warning message when you delete one one If you are new to VBA, this post is a place to start. The above example uses the name of the sheet (guide). Instead, you can use the name of the VBA Code for the spreadsheet: Activsheet name to get the name of a sheet: selected leaves versus activities at any time, only one sheet can be the activation sheet. However, we can use a simple function to find the name of a spreadsheet in a different workbook. ' public sub collsheets () dim sht as variant' Display the name and type of each sheet for each sht on thesworkbook.sheets debug.print sht.name & "is Type" & TypeName (sht) Pron "Ximo Sht End sub public sub collworksheets () dim sht as variant 'Display the name and type of each sheet for each sht on thesworkbook.worksheets debug.print sht.name & " © Type "& TypeName (SHT) At the next SHT End Sub if it does not have grain leaves and then use the leaf collection is the same as using spreadsheet collection. When you are selected, only the "top-top more" spreadsheet is considered active (the sheet of activity). You can change the name of the sheet and the name of the IDE in the leaf property window (see the image below). ' PUBLIC SUB SUB SETRAGEVALSOBJWith () DIM SHT as SHT = THISWARKBOOK.WORKSHEETS SET ("SHEET1") WITH SHT .Range ("A1") = 6 .range ("B2: B9"). Font.ITALIC = TRUE .range ("B2: B9"). Interior.color = RGBred End with sub -to -find the spreadsheet in a few words with all the different ways of accessing a spreadsheet, you may be feeling overwhelmed or confusing. Select spreadsheet if you want to select a spreadsheet instead of activating it. However, you will use it mainly to perform some action in one or more CLASS in the spreadsheet. To view this window, select View-> Immediate Window (or Ctrl G) Using the Code Name of a spreadsheet the best mother © All Access the spreadsheet is using the name of the Code. Select spreadsheet by guide name, it selects a spreadsheet based on Folha Guide Name Select spreadsheet by way of Advice this selects a spreadsheet based on the position of its position in relation to other guides select the spreadsheet with the VBA Code selecting spreadsheets by name of the name of the I can prevent the errors caused by the á € -by changes in the name of the spreadsheet. You should always specify the workbook when using spreadsheets. If the spreadsheet is in the same workbook as a way, use the name of the Code. If you look at the VBE property window, see both names. You can read the post from the innio to the end, as it is written in a wool order. Anywhere you see thisworkbook.worksheets ("Sheetname"), you can replace it with the name of the spreadsheet Code. 'Get the work folder dim wk as a working set of wk = work.open ("c:\ docs \ accounts.xlsx", readonly: = true) then get the dim sh out as defined spreadsheet sh = WK.Worksheets ("Sheet1") If you want to protect against the user changing the name of the sheet and use the function sheetfromcodename of the name of the Code. To do this, you need to specify which spreadsheet the new one should be inserted before or after. Learn more about the VBA automatro-automator builder that allows beginners to codify the procedures from scratch with the mother's knowledge of coding and with many time saving features for all user!
